

KRONOS

v1.2

User Guide

A shutdown timer built for people who want control over when their machine powers down — with style.

What is KRONOS?

KRONOS is a shutdown timer for Windows with a premium dark interface. It lets you schedule when your PC shuts down, restarts, sleeps, or locks — either by setting a countdown timer or choosing an exact time. But KRONOS goes further: it monitors your system in real time, can shut down automatically when your PC is idle or when a heavy task finishes, and includes built-in maintenance tools.

At a Glance

- Schedule shutdowns, restarts, sleep, or lock
- Countdown timer with 8 presets or custom duration
- Schedule by exact time (e.g. shut down at 23:00)
- Real-time CPU, RAM, and Disk monitoring
- Auto-shutdown when your PC is idle
- Auto-shutdown when CPU drops (task finished)
- Quick power menu for instant actions
- DNS cache flush and Disk Cleanup tools
- 5 languages: English, Spanish, German, Japanese, French
- Action history with date and time log
- Sound alert 60 seconds before the action executes

Timer Mode

The main screen shows a circular countdown ring with a digital clock in the center. Choose one of the preset durations or enter a custom time, select your action, and press Start countdown. The ring animates as time passes, and you can cancel at any moment.

Preset Durations

Preset	Duration
15 min	Quick nap or short break
30 min	Episode or short task
45 min	Study session
1 hour	Movie or workout
1.5 hours	Extended session
2 hours	Long task
3 hours	Overnight download
Custom	Any duration in hours, minutes, seconds

Schedule Mode

Switch to Schedule mode using the toggle above the presets. Enter the exact time you want the action to happen (24-hour format). KRONOS calculates how long until that time and starts the countdown. If the time has already passed today, it schedules for the next day automatically.

Example: set it to 23:00 and the display shows how many hours and minutes remain until 11 PM. Perfect for parents setting a bedtime shutdown or for scheduling overnight tasks.

Actions

Action	What it does
Shutdown	Powers off your PC completely
Restart	Reboots your PC
Sleep	Puts your PC in low-power sleep mode
Lock	Locks the screen (requires password to unlock)

Smart Monitoring

System Monitor

When no timer is running, KRONOS displays live system metrics inside the countdown ring: CPU usage, RAM usage, and Disk usage as percentages. The ring itself reflects your current CPU load, giving you an instant visual indicator of how hard your system is working. Metrics update every 2 seconds.

Inactivity Shutdown

Enable this in Settings under Monitoring. When turned on, KRONOS watches for mouse and keyboard activity. If your PC sits untouched for the duration you configure (default: 30 minutes, adjustable from 1 to 480 minutes), KRONOS shuts it down automatically.

Use case: you walk away from your desk and forget to turn off your PC. KRONOS handles it.

CPU Condition Shutdown

Enable this in Settings under Monitoring. KRONOS watches your CPU usage. When it stays below your configured threshold (default: 5%) for 3 consecutive minutes, it shuts down your PC.

This is the killer feature. Start a video render, a software compilation, or a large download. Enable CPU condition, and KRONOS will wait until the task finishes (CPU drops to idle) and then shut down automatically. No more leaving your PC running all night.

Monitoring Summary

Feature	Trigger	Default
Inactivity	No mouse/keyboard for X minutes	30 minutes
CPU Condition	CPU below X% for 3 minutes	5%

Quick Actions

The power button in the bottom-right corner opens a quick-action menu. Tap any option and it executes immediately — no timer, no countdown. Shutdown and Restart highlight in red. Sleep and Lock highlight in violet.

Think of it as a faster, prettier version of the Windows power menu, always one click away.

Built-in Tools

Flush DNS Cache

Found in Settings under Tools. One tap clears your DNS resolver cache. A confirmation popup shows the result. Useful when websites aren't loading properly, after changing DNS servers, or when troubleshooting network issues.

Temp Cleaner

Opens the Windows Disk Cleanup utility directly from KRONOS. Use it to free up disk space by removing temporary files, system cache, and other unnecessary data.

Action History

Every action KRONOS executes is recorded in the History log, accessible from Settings. Each entry shows the action type, the trigger source, and the exact date and time.

Trigger	Meaning
timer	Executed from a countdown timer
schedule	Executed from a scheduled time
quick	Executed from the quick actions menu
inactivity	Triggered by the inactivity monitor
condition	Triggered by the CPU condition monitor

History stores up to 50 entries. You can clear the entire log at any time with the Clear history button.

Languages

KRONOS is fully translated into five languages. Switch instantly from the language selector in the bottom-left corner. Your choice is remembered between sessions.

Language	Coverage
English	Complete — all screens, settings, tools, history
Spanish	Complete — all screens, settings, tools, history
German	Complete — all screens, settings, tools, history
Japanese	Complete — all screens, settings, tools, history
French	Complete — all screens, settings, tools, history

Sound Alert

When enabled in Settings, KRONOS plays an audio alert 60 seconds before the scheduled action executes. This gives you a last chance to cancel if you changed your mind. You can customize the sound by replacing the alert.mp3 file.
